Physical activity (hours/day) ¶	1.51 (1.39 , 1.63)	1.64 (1.45 , 1.82)	0.244

**Note:**

Abbreviations: CI, confidence intervals; NDNS RP, national dietary and nutrition survey rolling programme; BMI body mass index; WC, waist circumference; A1C, haemoglobin A1c; DM, diabetes mellitus.

Variables from the blood tests (glucose and A1C) are weighted by blood sample weights, the others are weighted by individual weights.

Glucose and A1C levels are estimated in subgroups of people without diabetes.

\* For continuous variables, the F test was used to determine differences between latent classes. For categorical variables, differences between latent classes were assessed using the adjusted Pearson Chi-2 test for survey data.

† Hypertension was defined as either systolic blood pressure  $\geq$  140 mmHg or diastolic blood pressure  $\geq$  90 mmHg, or under treatment for hypertension.

‡ Carbohydrate percent indicates the percentage of energy from carbohydrate in total energy intake

§ DM was defined by A1C  $>$  6.5%.

¶ Physical activity was calculated as mean time spent at moderate or vigorous physical activity during the survey.

Table 2: Level 1 class selection. (All data, n = 6155, 24483 data points)

Note:

Abbreviations: CI, confidence intervals; NDNS RP, national dietary and nutrition survey rolling programme; BMI body mass index; WC, waist circumference; A1C, haemoglobin A1c; DM, diabetes mellitus.

Variables from the blood tests (glucose and A1C) are weighted by blood sample weights, the others are weighted by individual weights.

Glucose and A1C levels are estimated in subgroups of people without diabetes.

\* For continuous variables, the F test was used to determine differences between latent classes with Bonferroni correction to account for multiple testing across >2 classes. For categorical variables, differences between latent classes were assessed using the adjusted Pearson Chi-2 test for survey data.

† Hypertension was defined as either systolic blood pressure  $\geq$  140 mmHg or diastolic blood pressure  $\geq$  90 mmHg, or under treatment for hypertension.

‡ Carbohydrate percent indicates the percentage of energy from carbohydrate in total energy intake

§ DM was defined by A1C > 6.5%.

¶ Physical activity was calculated as mean time spent at moderate or vigorous physical activity during the survey.

\* For continuous variables, the F test was used to determine differences between latent classes with Bonferroni correction to account for multiple testing across >2 classes. For categorical variables, differences between latent classes were assessed using the adjusted Pearson Chi-2 test for survey data.

<sup>†</sup> Paid employment was defined as being in paid employment during the last 4 weeks prior to the survey.

<sup>‡</sup> Live with partner was defined as either living with a married husband/wife or a legally recognised civil partnership.

**Note:**

Abbreviations: CI, confidence intervals; NDNS RP, national dietary and nutrition survey rolling programme;

BMI body mass index; WC, waist circumference; A1C, haemoglobin A1c; DM, diabetes mellitus.

Variables from the blood tests (glucose and A1C) are weighted by blood sample weights, the others are weighted by individual weights.

Glucose and A1C levels are estimated in subgroups of people without diabetes.

\* For continuous variables, the F test was used to determine differences between latent classes with Bonferroni correction to account for multiple testing across >2 classes. For categorical variables, differences between latent classes were assessed using the adjusted Pearson Chi-2 test for survey data.

<sup>†</sup> Hypertension was defined as either systolic blood pressure  $\geq$  140 mmHg or diastolic blood pressure  $\geq$  90 mmHg, or under treatment for hypertension.

<sup>‡</sup> Carbohydrate percent indicates the percentage of energy from carbohydrate in total energy intake

<sup>§</sup> DM was defined by A1C > 6.5%.

<sup>¶</sup> Physical activity was calculated as mean time spent at moderate or vigorous physical activity including both work-related and recreational activities during the survey.

Note:

Abbreviations: CI, confidence intervals; NDNS RP, national dietary and nutrition survey rolling programme;

BMI body mass index; WC, waist circumference.

Variables are weighted by nurse visiting weights.

\* Significant sex-specific differences by diabetic status assessed using an F test (with Bonferroni correction to account for multiple testing across >2 groups) for continuous variables or design-adjusted Pearson chi-square test

† Physical activity was calculated as mean time spent at moderate or vigorous physical activity including both work-related and recreational activities during the survey.

Table 12: Associations of carbohydrate eating patterns with hypertension, BMI, WC, and DM in the UK adults (NDNS RP 2008/09-2015/16, sample size = 6155).
